Our value-building blocks

Extending leadership in NGS-based precision oncology from late-stage to earlier stage patients

Notes:

¹ Minimal residual disease of solid tumors

² Companion diagnostics

Recent progress

Continued efficiency gains, driving towards profitability

Delivering results on

1 Driving sales efficiency

- Increasing sales productivity per head
- Benefiting from more rational industry competition

2 Improving gross margin

- Leveraging our scale
- Delivering on margin improvement projects

3 Reducing G&A expenses

- Cutting overhead and lowering fixed cost-base

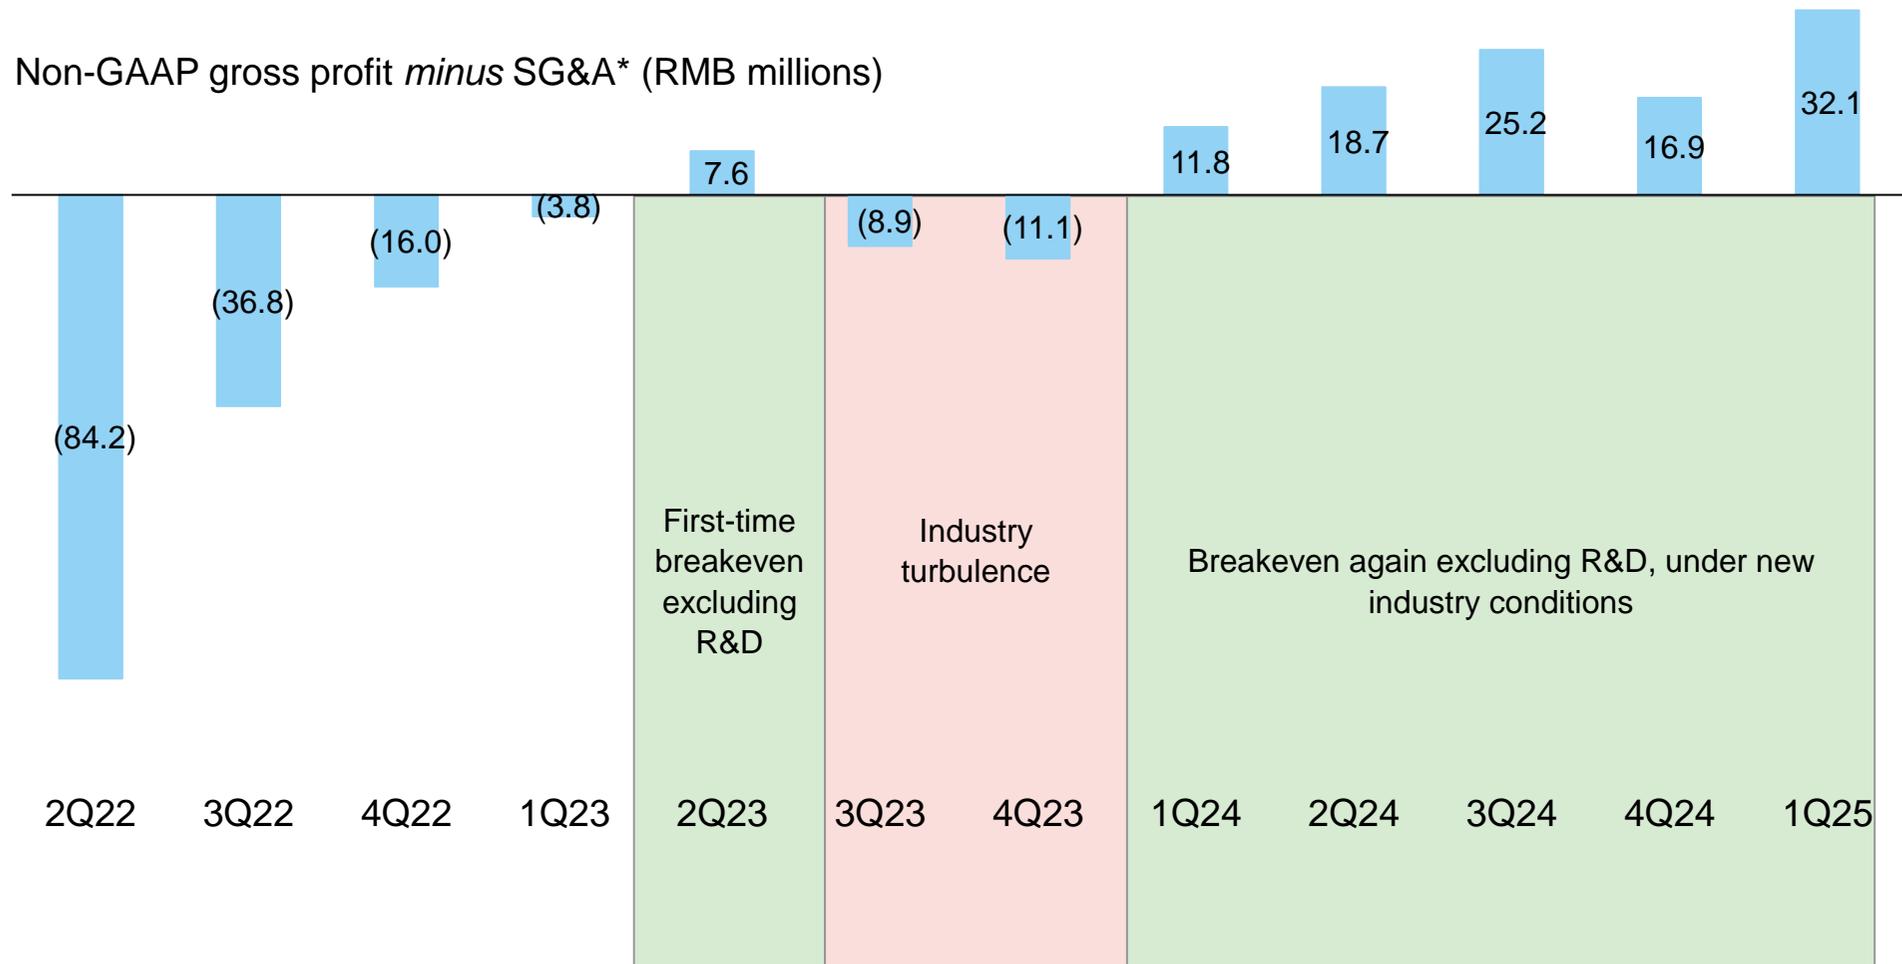

4 Reducing R&D expenses

- As clinical programs complete and run down
- Disciplined on new investment

1Q25 continues to get commercial breakeven under new industry conditions

Breakeven defined as Non-GAAP gross profit *minus* SG&A*

Non-GAAP gross profit *minus* SG&A* (RMB millions)

Notes:

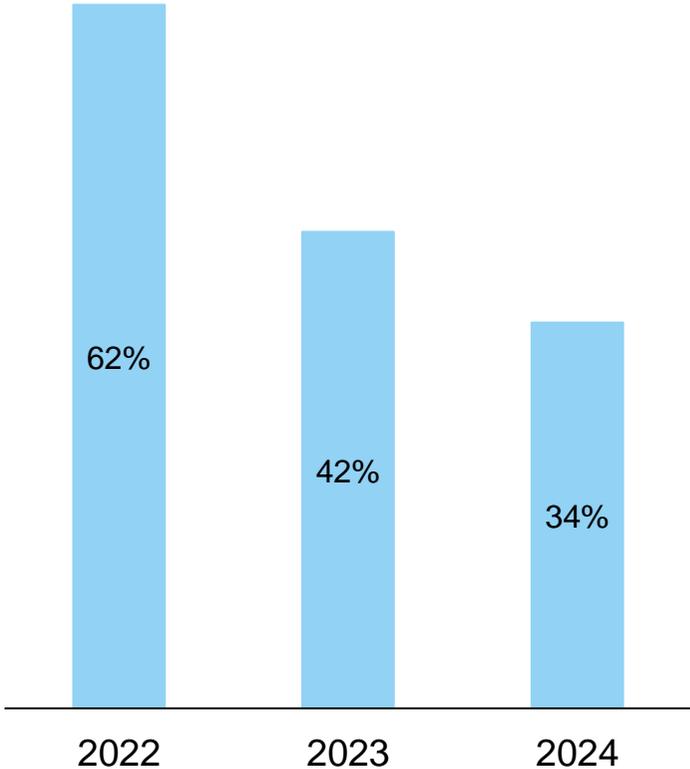

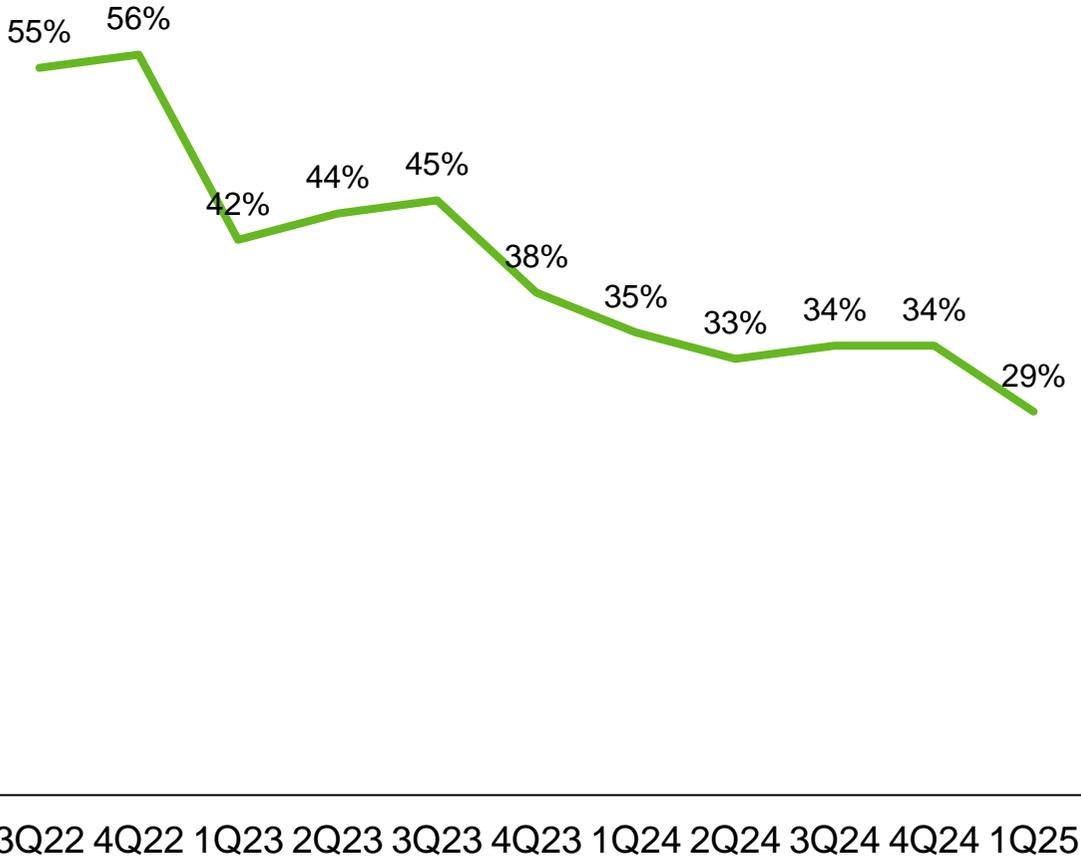

* Non-GAAP gross profit, which is defined as gross profit excluding depreciation and amortization. Non-GAAP SG&A refers to selling and marketing expenses and general and administrative expenses, both excluding their respective share-based compensation and depreciation and amortization.

1

Driving sales efficiency

Expect below 40% selling expense going forward

Non-GAAP sales and marketing expenses as % of revenue*

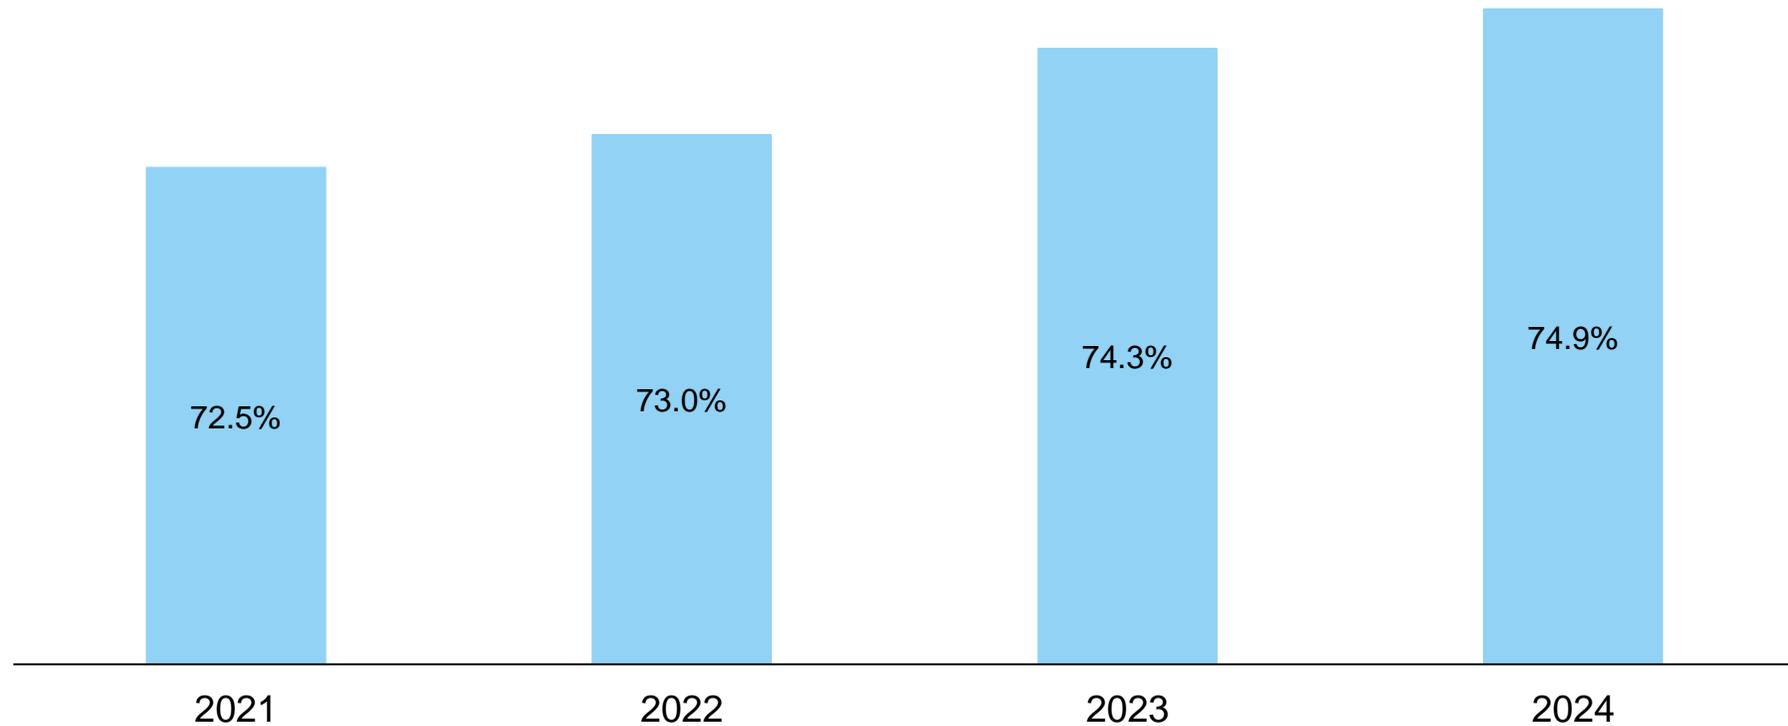

Notes:
* Excluding share based compensation (SBC) and depreciation and amortization (D&A)

2 Improving gross margin

Delivering on margin improvement initiatives

Non-GAAP gross profit as % of revenue*

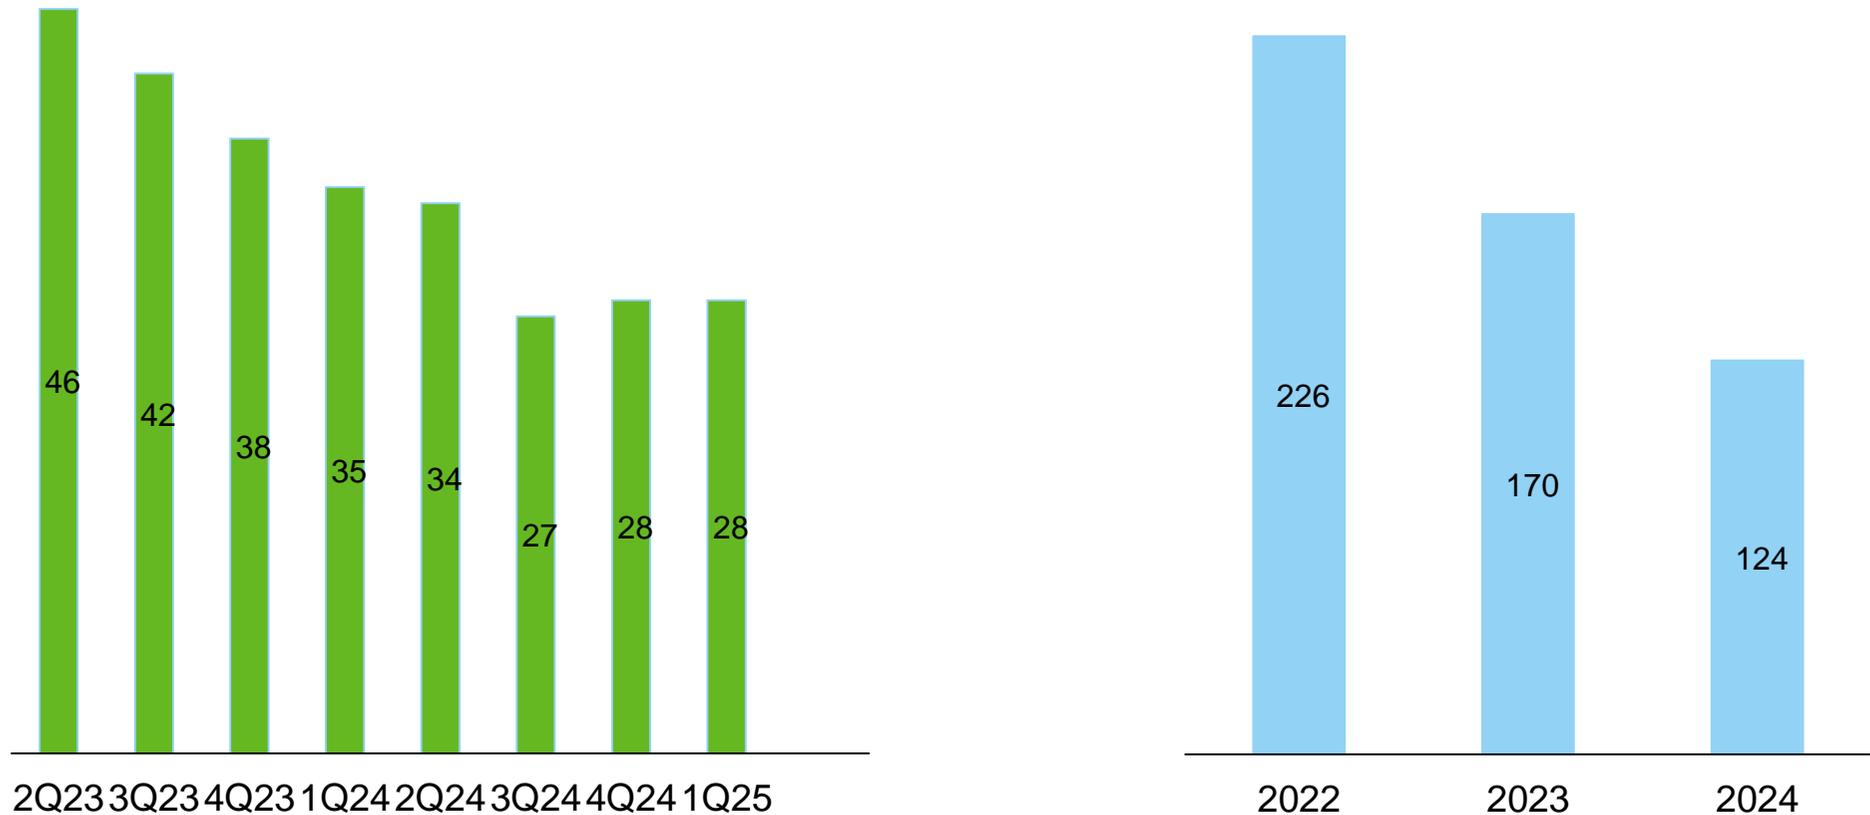

Notes:

* Non-GAAP gross margin, which is defined as gross margin excluding depreciation and amortization (D&A)

3 Reducing G&A expenses Cost savings going into 2025

General and admin expenses *minus* noncash items * (RMB millions)

Notes:

* Excluding share based compensation (SBC), depreciation and amortization (D&A) and allowance for doubtful accounts.

Commercial operation (excluding R&D expenses) reached profitability in 1Q2025

RMBm	2022	2023	2024	1Q2025

In brief

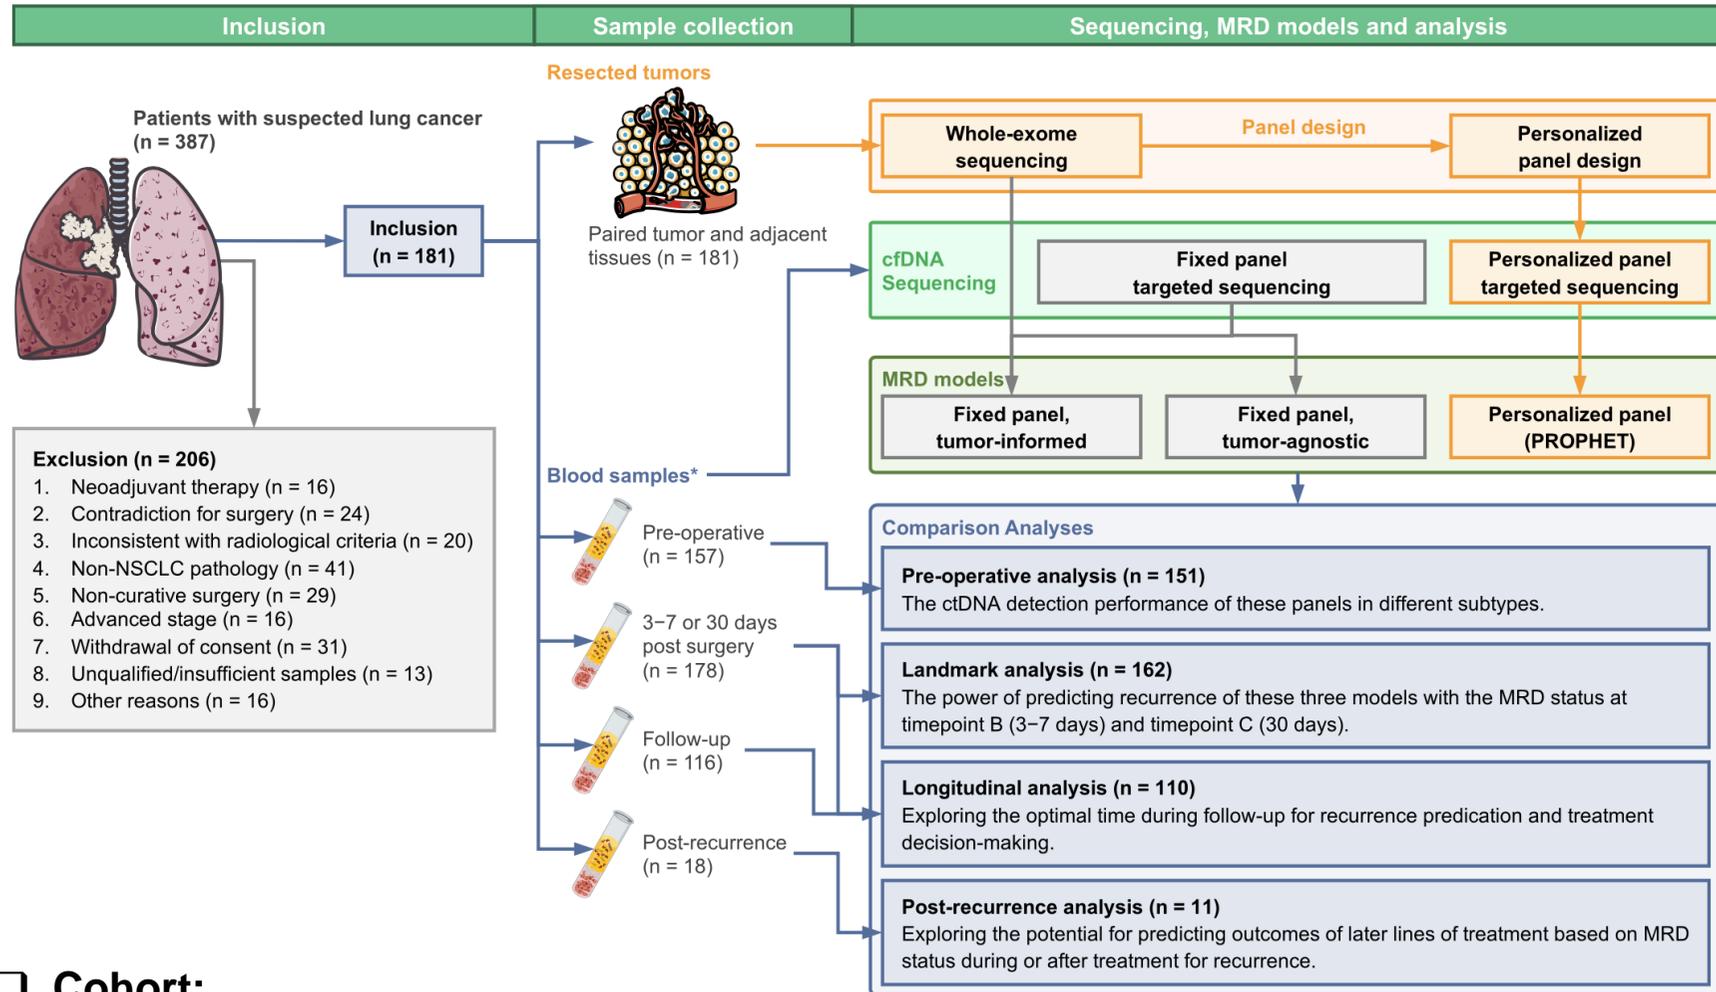

Chen et al. introduced personalized Patient-specific pROgnostic and Potential tHERapeutic marker Tracking (PROPHEt) for detecting molecular residual disease (MRD) in NSCLC, featuring a notably low limit of detection (LOD). It exhibits elevated sensitivity and extended lead time than radiologically confirmed recurrence. It also facilitates prognostic accuracy and postoperative treatment evaluation.

Highlights

- PROPHEt outperforms fixed-panel MRD assays in head-to-head comparison in NSCLC
- TNMB stage, integrating landmark ctDNA MRD and TNM, improves prognosis prediction
- PROPHEt illustrates a median lead time of 299 days to radiological recurrence
- Post-relapse ctDNA status facilitates decision on later lines of treatment

Study design

□ Cohort:

- 181 patients enrolled Stage I (63%), II (19%), and III (18%)

□ Sampling Time:

- Tumor and adjacent paired tissue collected at surgery
- Blood samples collected at Pre-operative, 3 days, and 30 days post-surgery
- Median Follow-up Time: 30 months

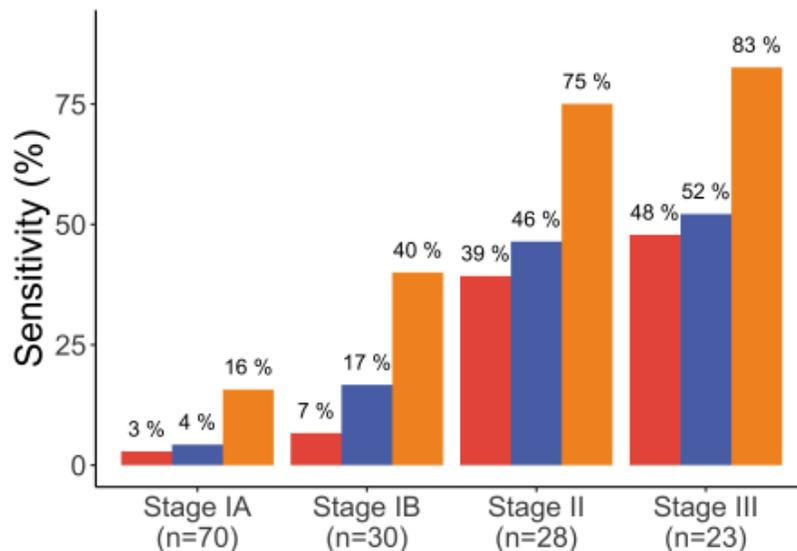

CanCatch[®] Custom demonstrates superior sensitivity in ctDNA detection

Clinical validation with pre-operative plasma samples

(a)

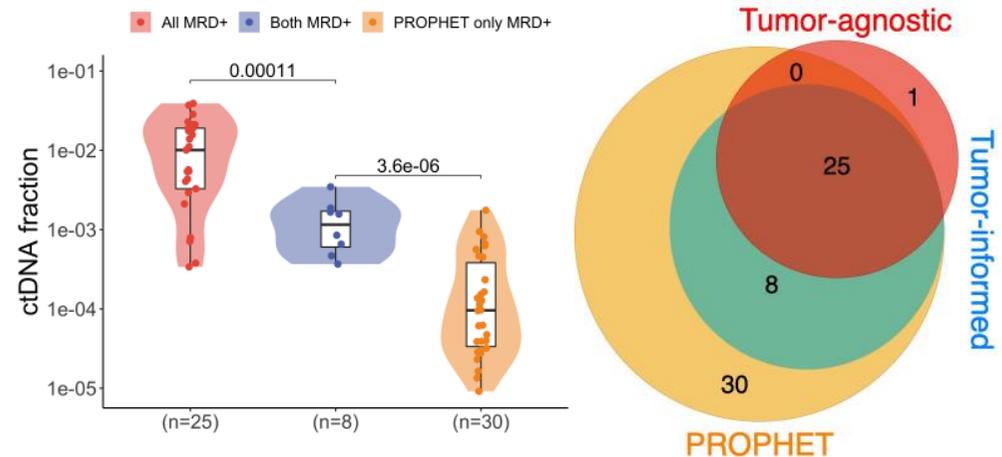

Sensitivity of pre-operative plasma

■ Tumor-agnostic ■ Tumor-informed ■ PROPHET

(b)

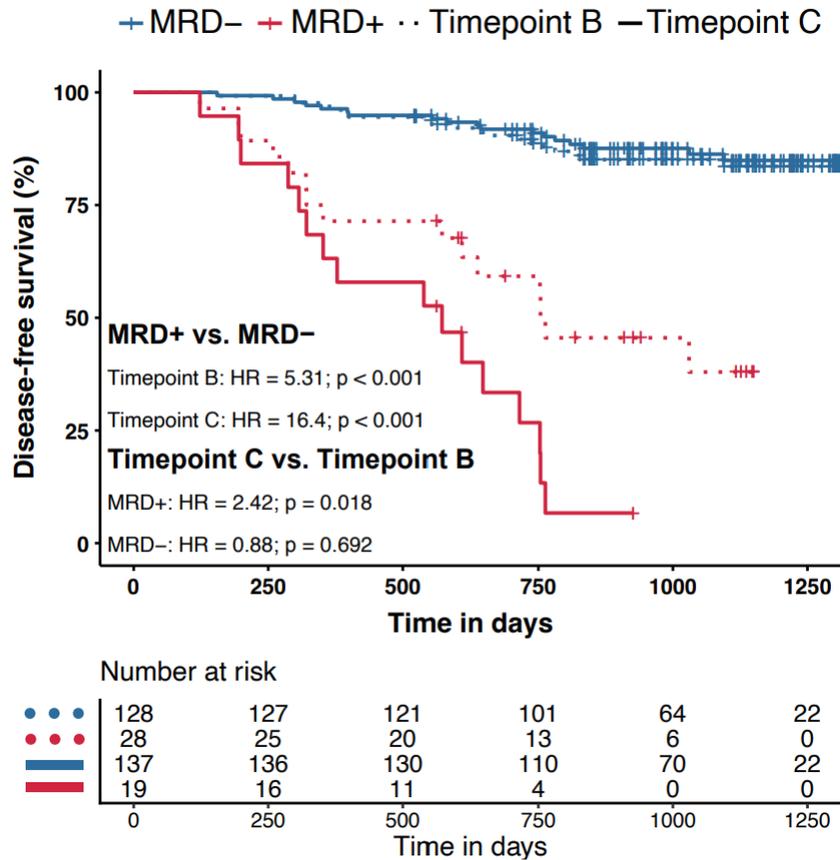

ctDNA fraction distribution of MRD (+) samples detected by different methods

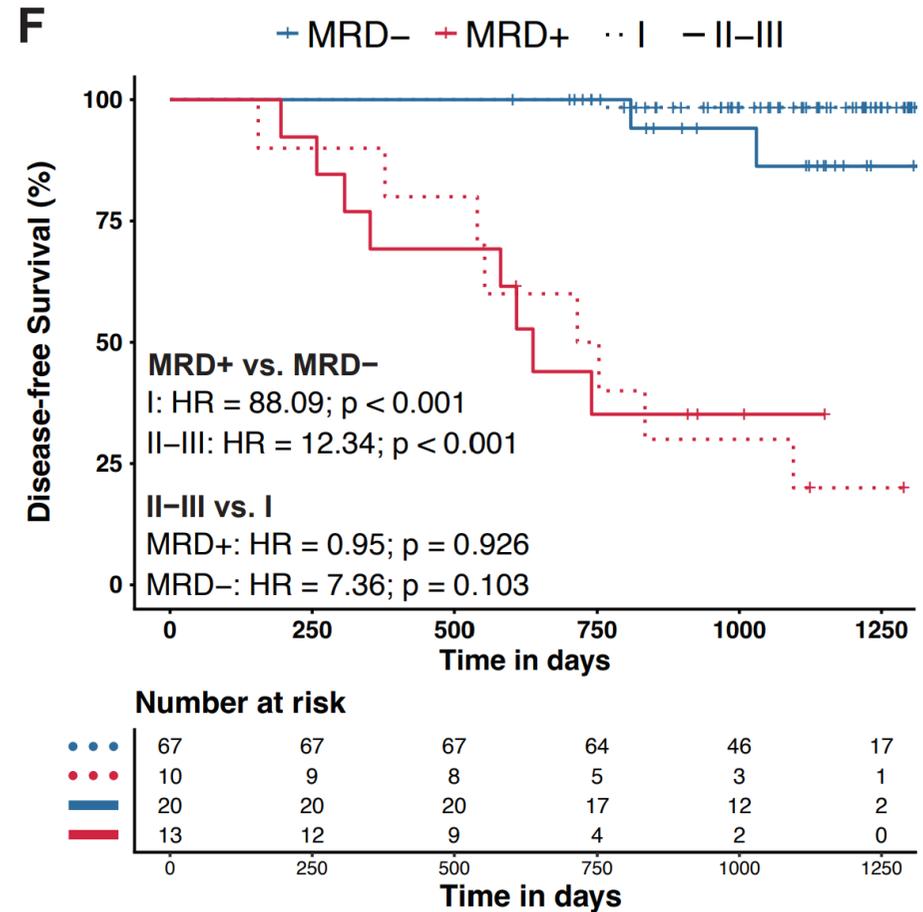

- For pre-operative plasma from patients with different clinical stages, CanCatch[®] Custom has a higher sensitivity than the other two methods
- The median ctDNA fraction of the 30 patients detected by CanCatch[®] Custom alone was significantly lower than the 25 patients detected by all three MRD assays

The patient-specific CanCatch[®] Custom has a higher sensitivity than the two fixed panel detection methods

CanCatch[®] shows strong prognostic value in post-surgery NSCLC patients

Product Development Roadmap

6-cancer test marker discovery and model training

The THUNDER study, 2395 participants

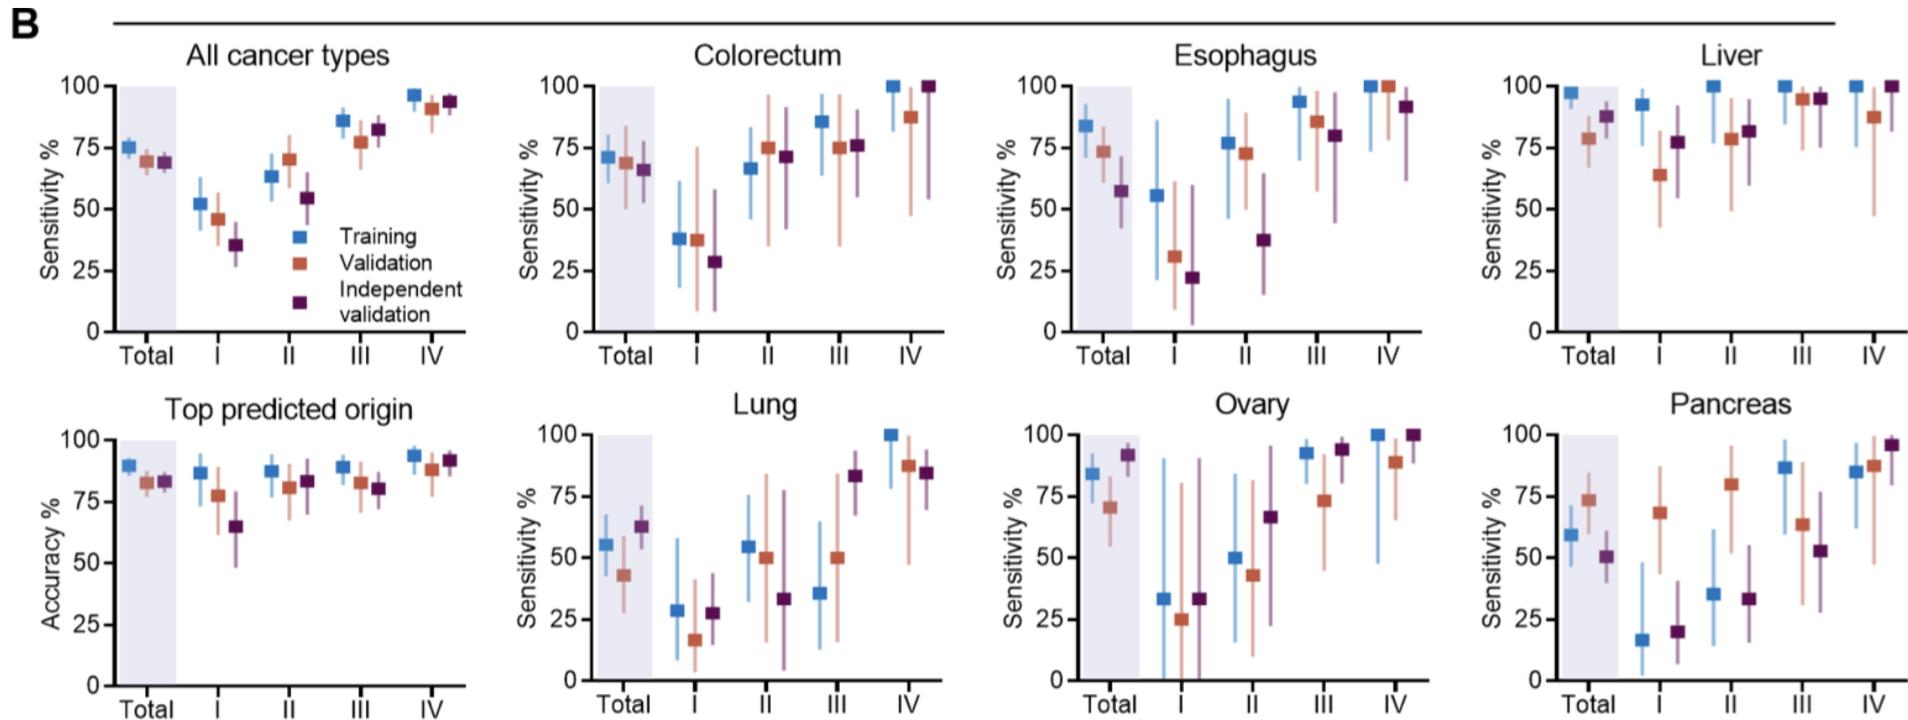

A customized panel of 161,984 CpG sites was constructed and validated by public and in-house (cancer: n = 249; non-cancer: n = 288) methylome data, respectively. The cfDNA samples from 1,693 participants (cancer: n = 735; non-cancer: n = 958) were retrospectively collected and divided into training and validation sets to establish and test two multi-cancer detection blood test (MCDBT-1/2) models. Both models were blindly validated on a prospectively enrolled, independent validation cohort of age-matched 1,010 participants (cancer: n = 505; non-cancer: n = 505).

6-cancer test, detection-of-cancer performance in case-control cohorts

The THUNDER study

Fig 3. Performance of the MCDBT-1/2 models. A. Sensitivity, specificity, accuracy of top predicted origin, and accuracy of top two predicted origins. **B.** The overall sensitivity, accuracy of top predicted origin, and sensitivity stratified by cancer types reported by tumor stage.

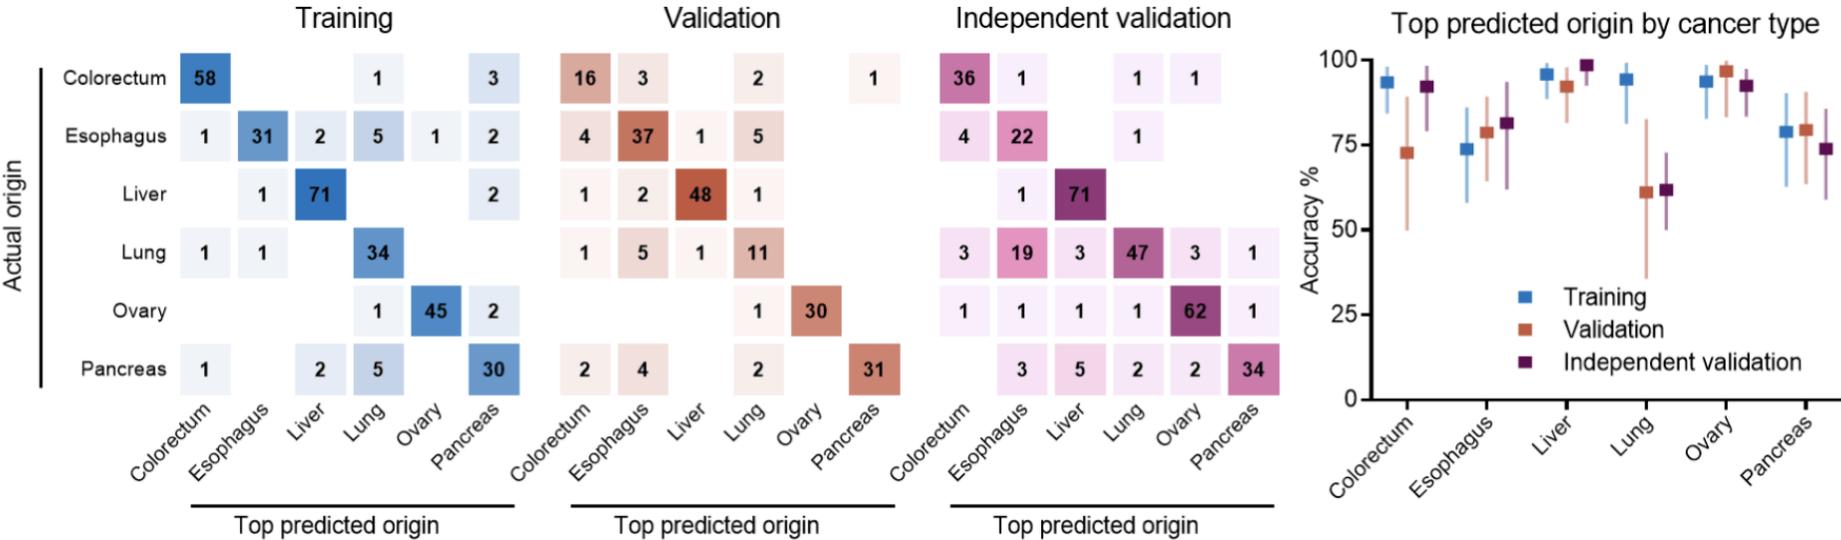

Data set	Specificity (%)	Sensitivity (%)	Accuracy of top predicted origin (%)	Accuracy of top two predicted origins (%)
Training set	99.7 (98.9-100.0)	75.2 (70.6-79.4)	89.7 (85.7-92.9)	94.7 (91.5-96.9)
Validation set	100.0 (97.0-100.0)	69.4 (63.9-74.6)	82.8 (77.0-87.6)	89.4 (84.5-93.3)
Independent validation set	98.9 (97.6-99.7)	69.1 (64.8-73.3)	83.2 (78.7-87.1)	91.7 (88.2-94.5)

6-cancer test, top-predicted-origin performance in case-control cohorts

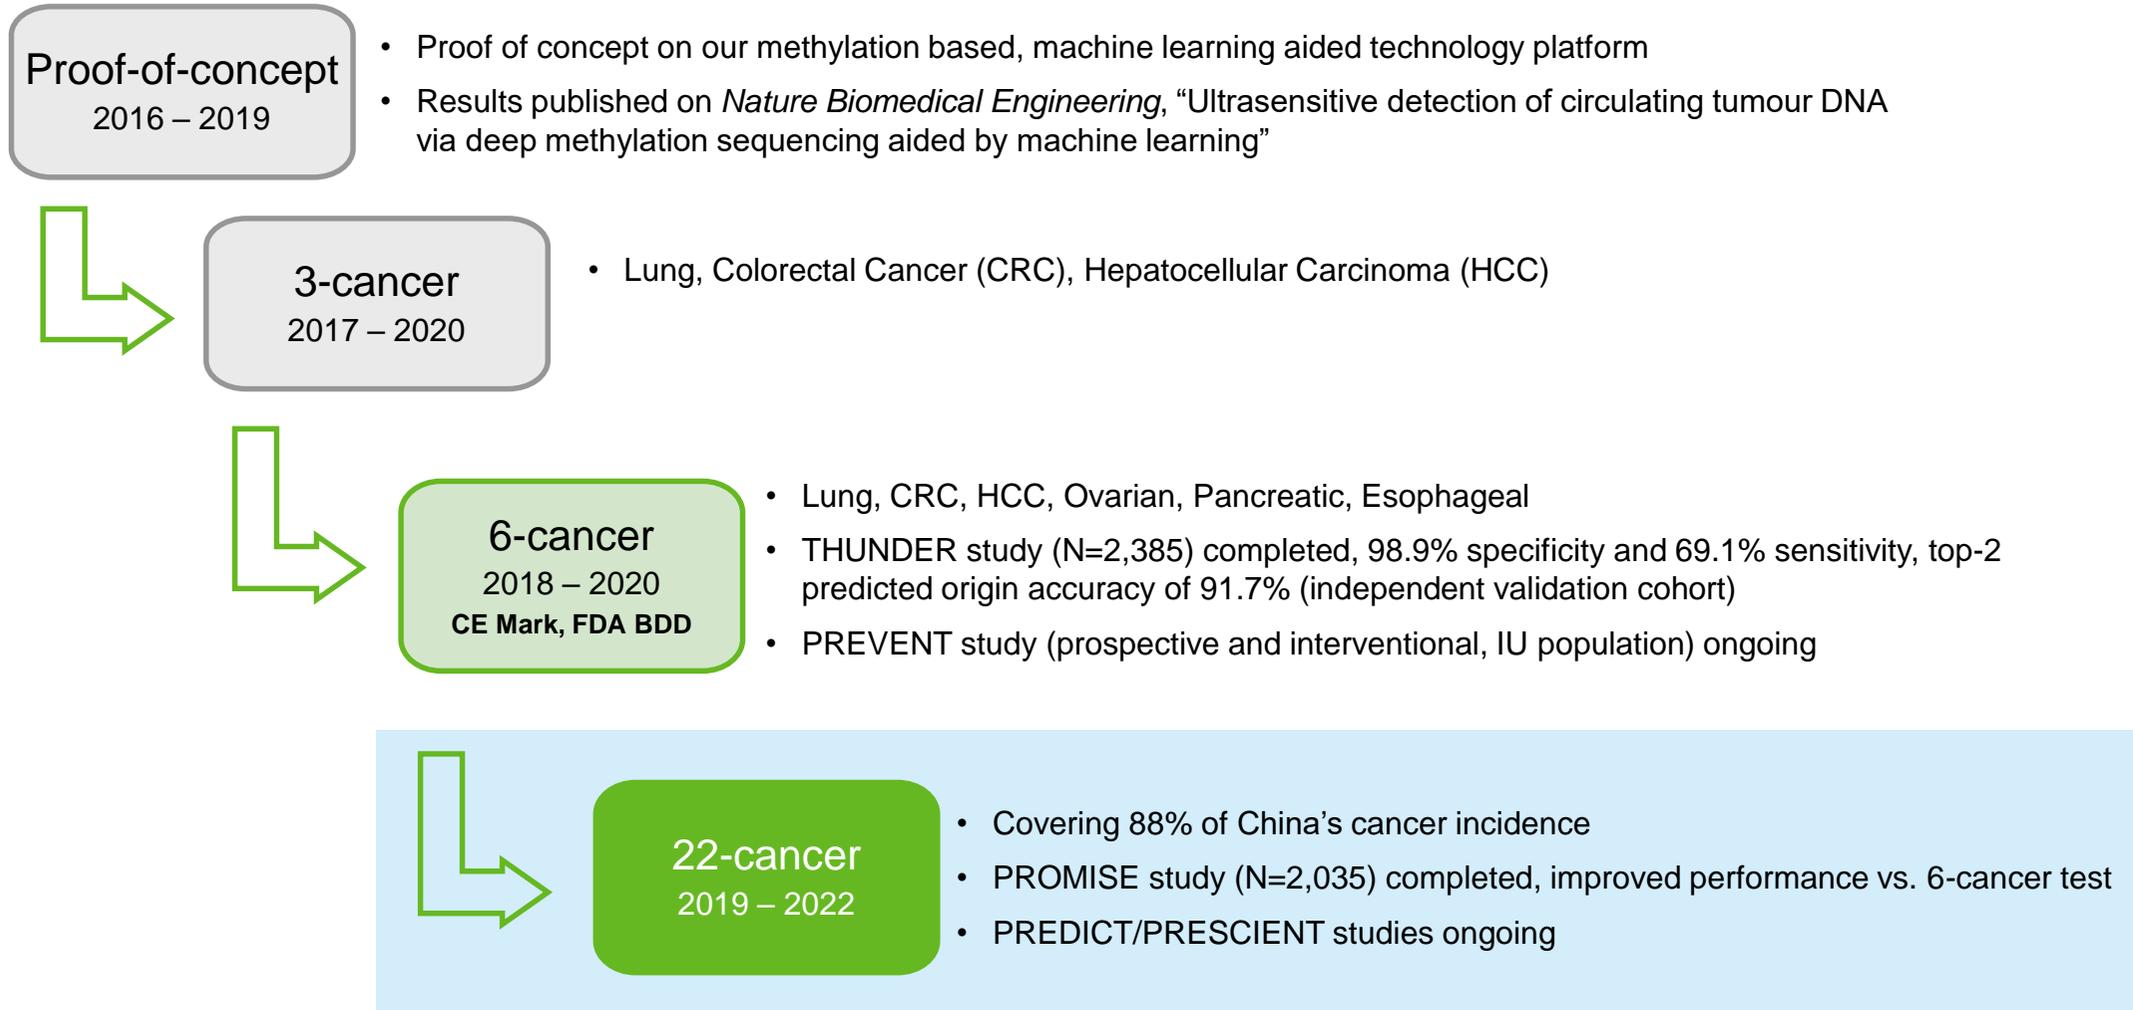

The THUNDER study

Fig 4. Top predicted origin for the MCBDT-1 model. Confusion matrices representing the predicted origin in the training, the validation, and the independent validation sets.

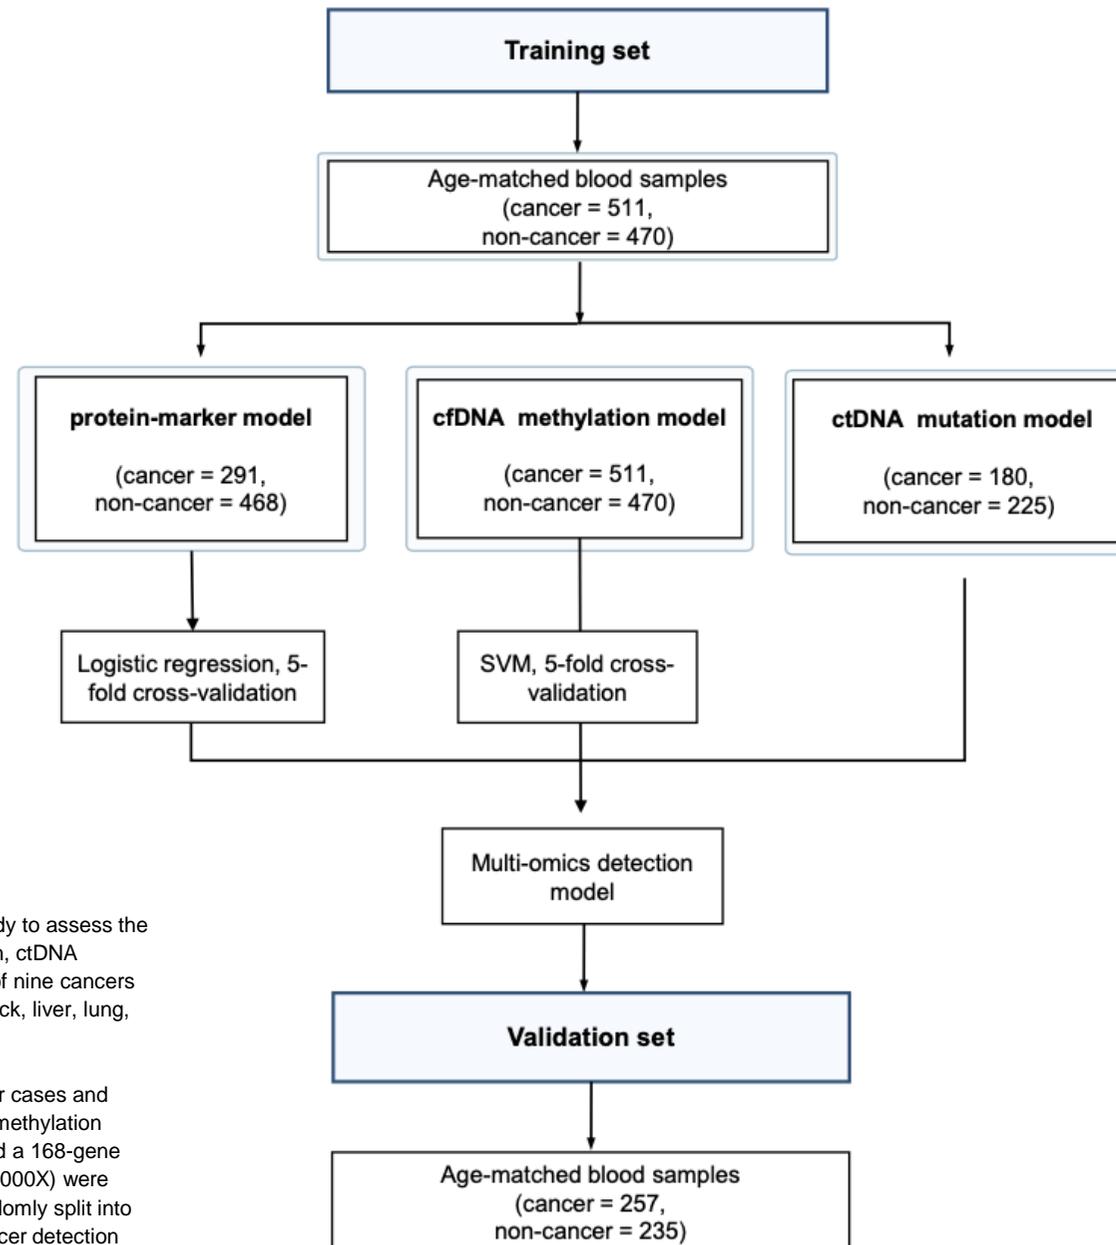

Data set	Specificity (%)	Sensitivity (%)	Accuracy of top predicted origin (%)	Accuracy of top two predicted origins (%)
Training set	99.7 (98.9-100.0)	75.2 (70.6-79.4)	89.7 (85.7-92.9)	94.7 (91.5-96.9)
Validation set	100.0 (97.0-100.0)	69.4 (63.9-74.6)	82.8 (77.0-87.6)	89.4 (84.5-93.3)
Independent validation set	98.9 (97.6-99.7)	69.1 (64.8-73.3)	83.2 (78.7-87.1)	91.7 (88.2-94.5)

Product Development Roadmap

9-cancer test, multi-omics model

The PROMISE study

PROMISE is a prospective multicenter case-control study to assess the performance of multi-omics including cfDNA methylation, ctDNA mutation and protein biomarkers in the early detection of nine cancers in the biliary tract, colorectum, esophagus, head and neck, liver, lung, ovary, pancreas and stomach.

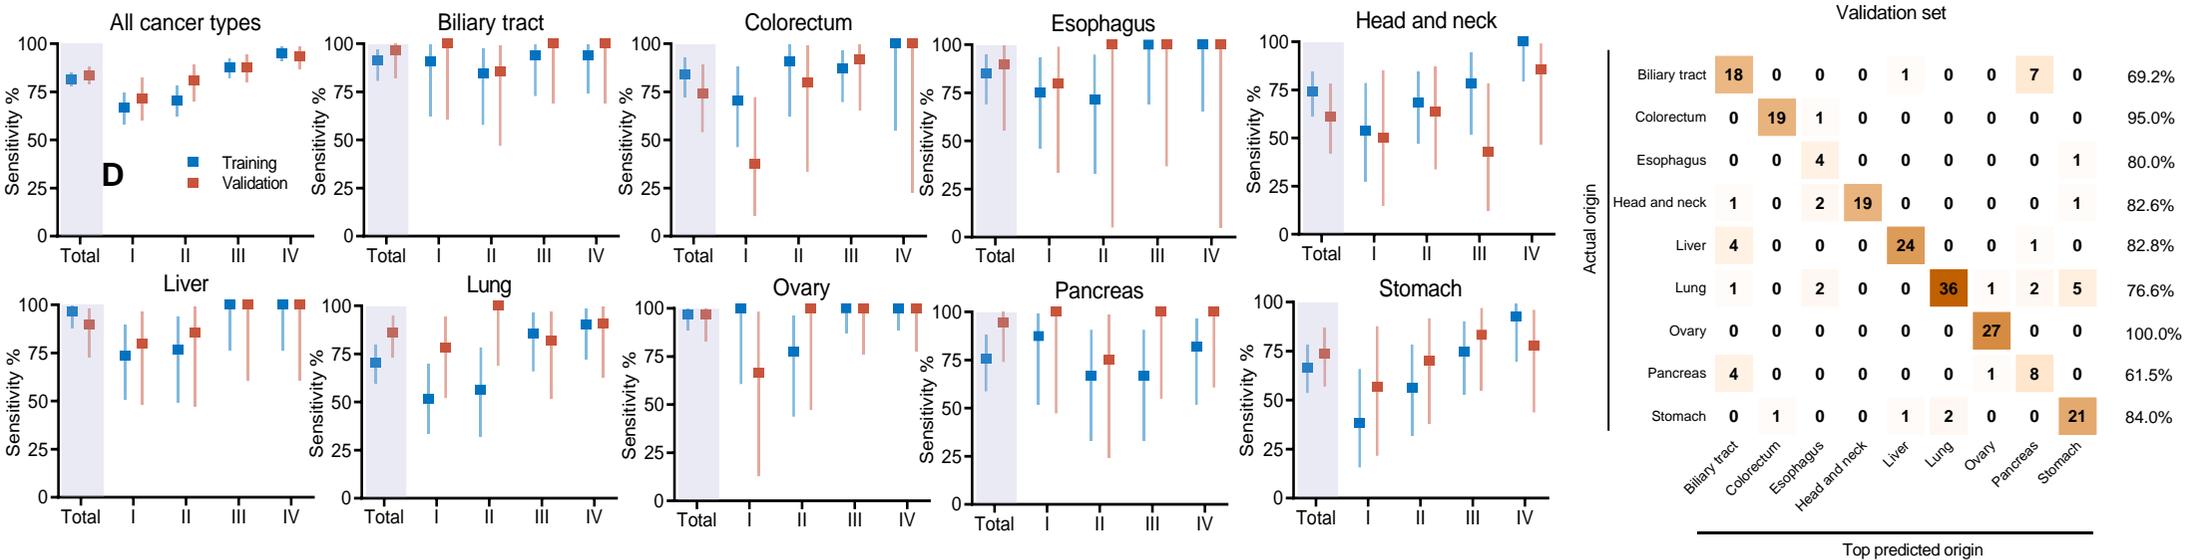

Blood samples were prospectively collected from cancer cases and non-cancer controls. A targeted cell-free DNA (cfDNA) methylation panel of ~490,000 CpG sites (1,000X) by ELSA-seq and a 168-gene mutation panel (35,000X, matched white blood cells:10,000X) were sequenced. Age-matched cases and controls were randomly split into training (n = 981) and test sets (n = 492). The multi-cancer detection blood test (MCDDBT) models were developed in the training set and then validated in the test set.

9-cancer test multi-omics model performance

The PROMISE study

	Cancer (n)	Non-cancer (n)	Specificity (%)	Sensitivity (%)	Accuracy of top predicted origin (%)
Training	470	511	97.9% (96.1%-99.0%)	81.7% (78.1%-84.9%)	86.6% (83.0%-90.0%)
Validation	257	235	98.3% (96.6%-99.4%)	83.7% (79.0%-88.0%)	81.9% (76.0%-87.0%)

	Multi-omics	Methylation	Mutation	Protein
Specificity (95% CI)	98.3% (96.6%–99.4%)	99.1% (97.3%–99.8%)	99.6% (97.9%–100.0%)	99.6% (98.7%–100.0%)
Sensitivity (95% CI)	83.7% (78.6%–88.0%)	79.0% (73.5%–83.8%)	49.4% (41.9%–57.0%)	47.8% (40.8%–54.9%)

- PROMISE demonstrated 83.7% sensitivity and 98.3% specificity for 9 cancers
- Methylation contributed >90% of the total sensitivity, while protein and mutation collectively provided <10% additional positive detections

Burning Rock's 22-cancer test covers 88% of China's cancer incidence

Notes:

¹ Incidence data per "2018 China cancer registry annual report ", J He et al., ISBN 978-7-117-28585-8

² Final number of cancer types subject to development progress

Leadership in multi-cancer early detection

First-in-class, high entry-barrier, multi-year efforts

Challenges

BNR position

1

Technology

Low amount of cancer signal
in the circulating bloodstream, much more
challenging compared to tissue

Proprietary chemistry and algorithm

- On par with global leader, competitive sensitivity in earlier stages for certain cancers
- Multi-year lead vs. China peers (most showing liver-cancer and colon-cancer data only)

2

Clinical

Large, multi-year studies required
from case-control to intend-to-use population, from
observational to interventional (e.g. CCGA study:
15,254 participants, 8,584 with cancer, 6,670
without cancer)

Sponsorship from top physicians

- Catching up with global leader, to improve specificity and tissue-of-origin performance through large clinical studies
- Multi-year lead in China as the only company that has launched studies with over 10,000+ subjects

3

Regulatory

First-in-class
with no established regulatory pathway

Leading regulatory capability in China

- Exploring possible pathway, leveraging experience through the country's first NMPA-approved NGS kit

4

Commercial

Unprecedented product

Multi-pronged approach

- Initially working with hospitals' health check-up departments, leveraging synergy from in-hospital therapy selection business

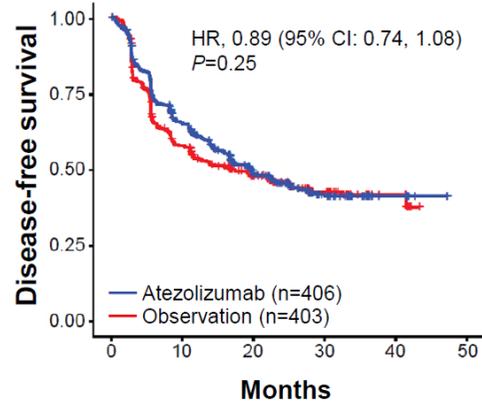

Appendix 2

MRD

How do MRD studies advance utility

Example 1: IMvigor010, enrich the high-risk group and "tune-up" adjuvant treatment

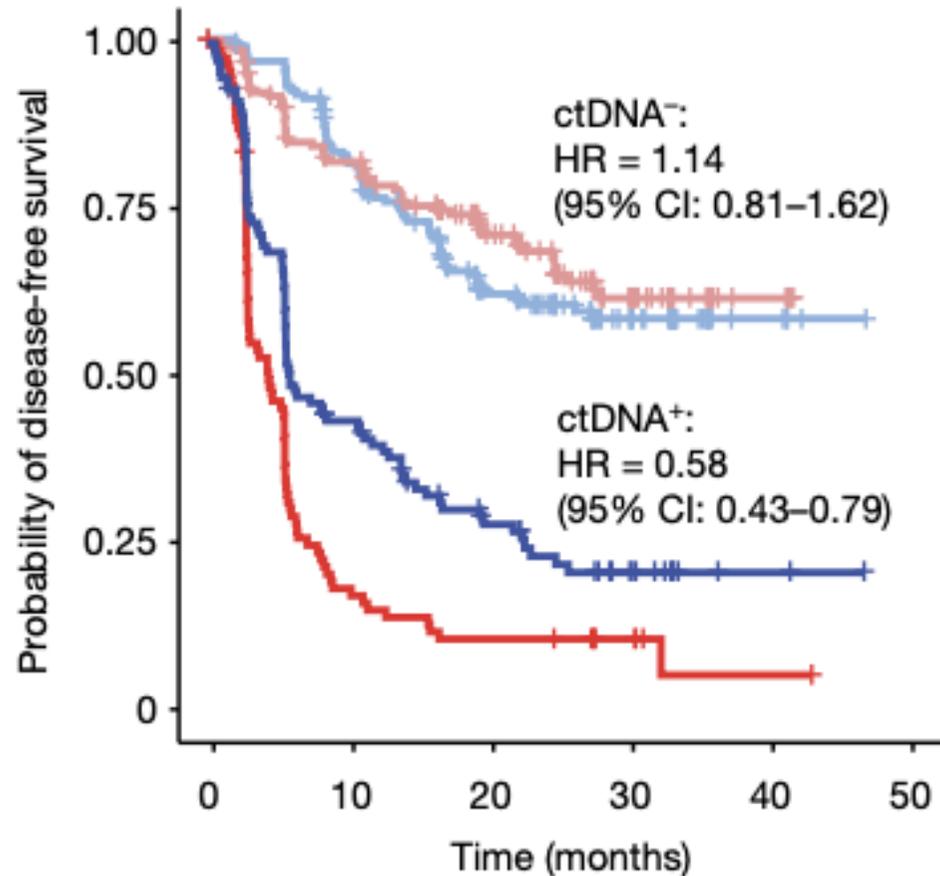

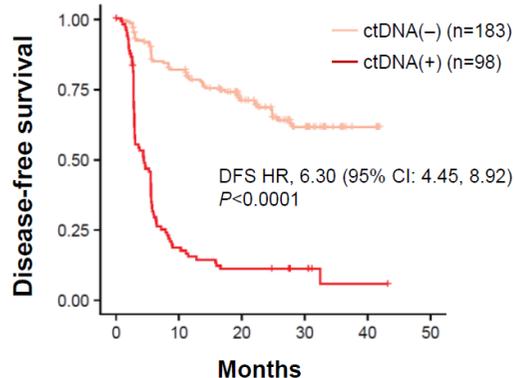

ITT

Atezo, MIUC Adjuvant Therapy
"All comers" demonstrated NO efficacy
TMB/PD-L1 showed NO prediction

Observation arm

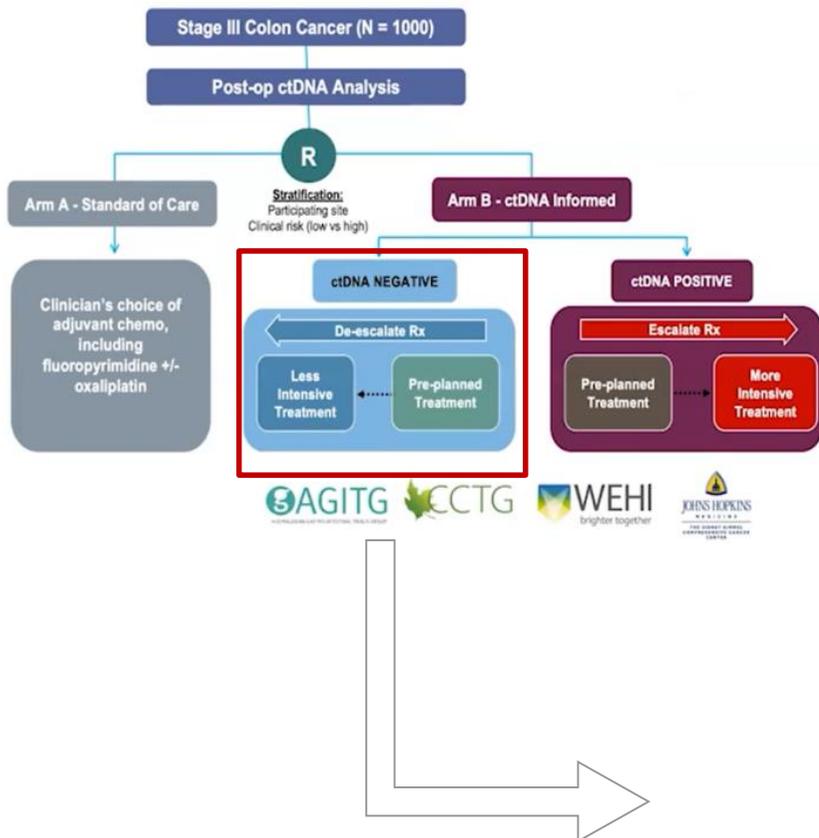

Indeed, only baseline MRD+ pts showed benefit

Landmark MRD+ pts (39%) had worse prognosis
Maybe only those patients can benefit?

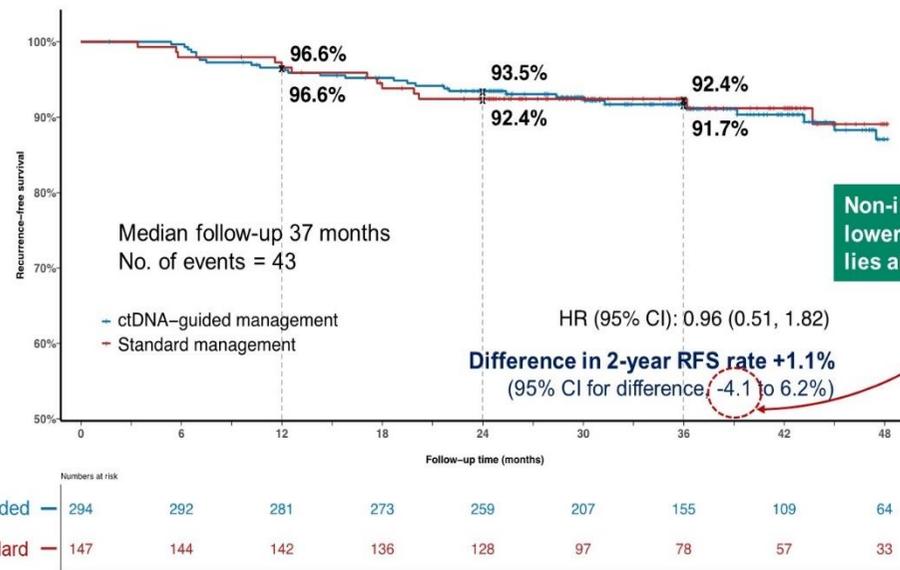

How do MRD studies advance utility

Example 2: Dynamic, identify low-risk patients and “tune-down” adjuvant treatment

DYNAMIC-III

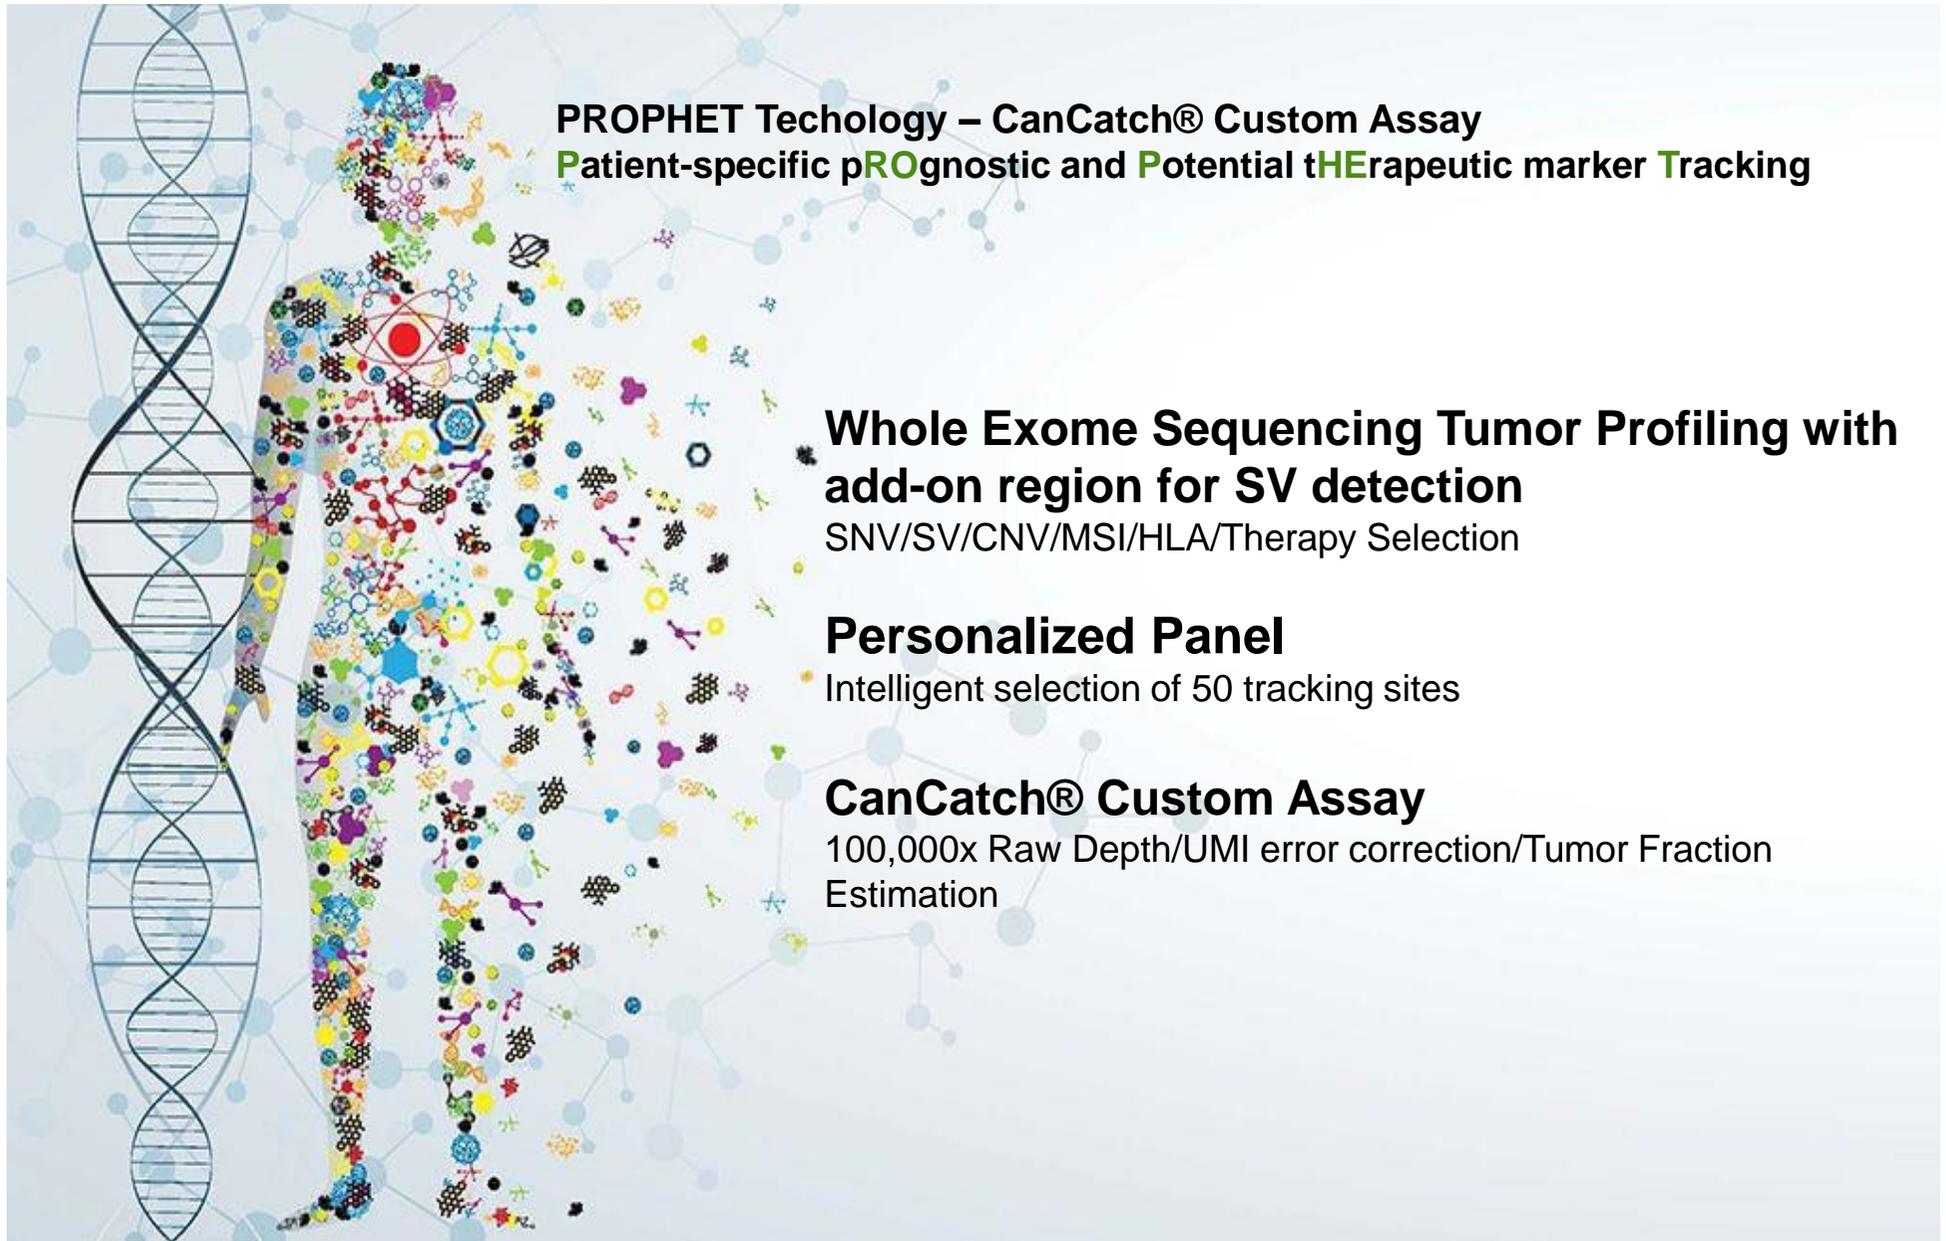

ctDNA-guided vs standard

The ctDNA-guided MRD- group had fewer patients with adjuvant chemotherapy than the standard group (15% vs. 29%) with non-inferiority of 3-year RFS (92.4% vs 91.7%)

- Only 30ng DNA input required, applicable to small tissue samples
- First NMPA approved NGS kit with CNV² mutation type, with MET exon14 skipping

Notes:

¹ The list is not exhaustive. A total of 13 kits have been approved by the NMPA as of the date of this presentation

² Copy number variation

Leading liquid-biopsy product in China, with globally competitive performance

Demonstrated in high-impact analytical validation study

SEQC2
Study
Overview

MAQC/SEQC Consortium Projects – An Overview

- An FDA-led community-wide consortium effort to assess technical performance and application of emerging technologies (e.g., genomics).

Issues and Study Objectives

- FDA approved several NGS tests with sensitivity for AF ~5%
- Hundreds lab developed tests (LDT): sensitivity ~ 2-10%
- FDA approved ctDNA tests with sensitivity for AF ~0.3%

Evaluating the analytical validity of circulating tumor DNA sequencing assays for precision oncology

- False positive rate estimate through known negatives
- All of them by VAF ranges:
 - 0.1 - 0.5%, 0.5 - 2.5%, >2.5%
 - Finer VAF ranges for sensitivity: 0.1 - 0.2%, 0.2 - 0.3%, 0.3 - 0.5%
- Evaluate the impact of DNA input amount
 - Three levels of input for Ef: 10ng, 25ng, 50ng
- Evaluate the impact of synthetic plasma (DNA extraction)
 - Qubit HS calibration and quantification
 - Calculate extraction yield

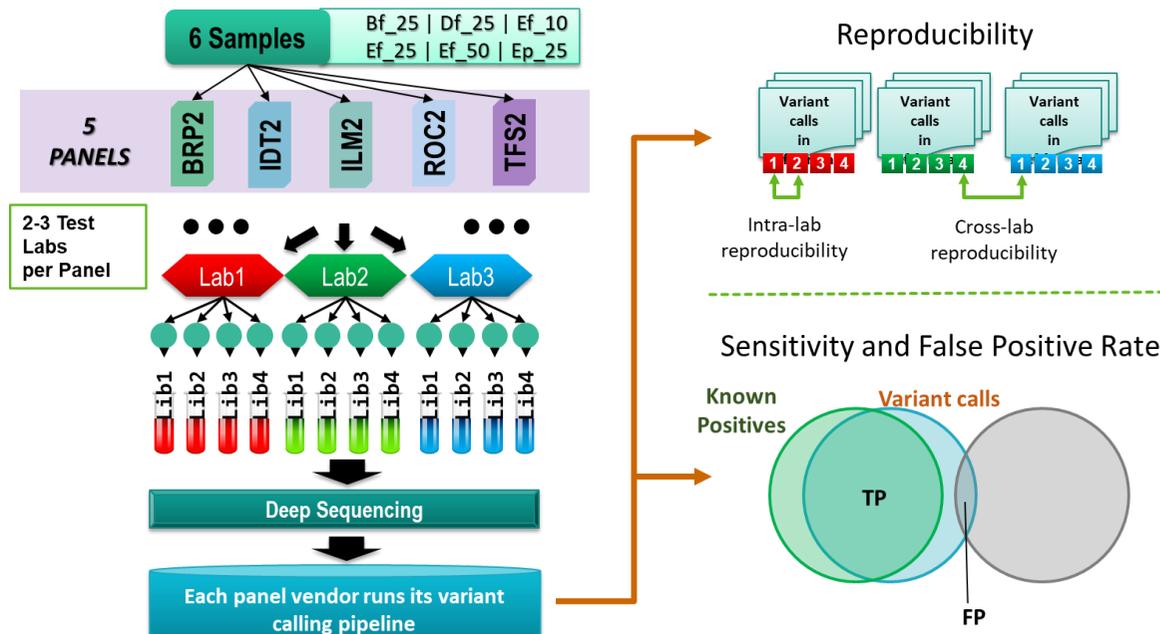

- Enzymatic fragmentation
 - better ligation efficiency
- Gel-based size selection (160bp-180bp) to mimic cfDNA
- 1ng/ul to mimic concentration after DNA extraction from plasma
- Ep: 40ng/ml Ef in synthetic plasma

BRP2: Burning Rock Dx LungPlasma v4
IDT2: IDT xGen Non-Small Cell Lung Cancer
ILM2: Illumina TruSight 170 with UMI
ROC2: Roche AVENIO ctDNA Expanded Kit
TFS2: Thermo Fisher Oncomine Lung cfDNA Assay

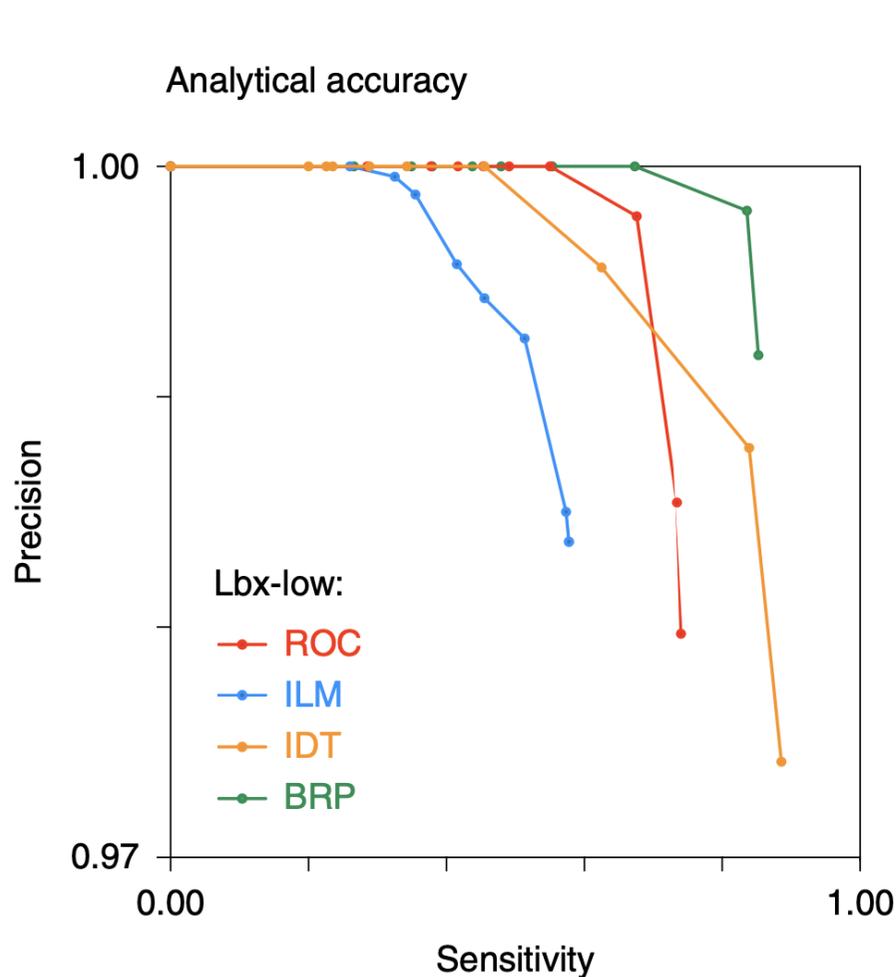

Liquid
Biopsy

Participating assays and study design

Name	Vendor	ctDNA assay	Sequencing platform	Target genes	Reportable region (kb)	Coding (kb)	CTR (kb)	Negatives (× 1,000)	Variants
ROC	Roche Sequencing Solutions	AVENIO ctDNA (Expanded Kit)	Illumina NextSeq	77	161.7	140.2	103.8	47.1	189
ILM	Illumina	TruSight Tumor 170 + UMI	Illumina NovaSeq	154	501.0	390.1	338.4	133.0	574
IDT	Integrated DNA Technologies	xGen Non-small Cell Lung Cancer	Illumina NovaSeq	24	110.1	93.2	76.5	39.3	130
BRP	Burning Rock Biotech	Lung Plasma v4	Illumina NovaSeq	168	226.9	148.5	125.1	53.4	229
TFS	Thermo Fisher Scientific	Oncomine Lung cfDNA assay	Ion Torrent S5 XL	11	1.9	1.6	1.3	0.8	5

Overall analytical accuracy and specificity

Assay	Known negatives (kb)	FPs per replicate (mean [range])	FP-rate (FP / kb) at specified VAF threshold		
			> 0%	> 0.1%	> 0.5%
ROC	47.1	2.91 [1-6]	0.061	0.044	0.000
ILM	133	5.25 [2-10]	0.039	0.039	0.008
IDT	39.3	2.75 [0-6]	0.070	0.057	0.000
BRP	53.4	1.65 [0-5]	0.030	0.007	0.000

The analytical accuracy was measured by **Precision-Sensitivity** plot (25ng LBx-Low)
 The false positive rates were computed by FP/kb region.
 Once different VAF threshold increases, FP rates dropped further.

“To compare the accuracy of the participating ctDNA assays, we generated precision recall curves, ranking known variants and FPs according to their observed VAFs. **For Lbx-low samples at 25ng input, BRP was the most accurate assay, with roughly equivalent sensitivity but superior precision to IDT** (Fig. 4b and Supplementary Fig. 4c).”

Performance – Sensitivity

- LBx-low (25 ng input) replicates in each participating assay in different expected VAF bin.

“The most sensitive assays (IDT and BRP) achieved sensitivity greater than 0.90 for variants with 0.3–0.5% VAF; however, no assays reached this mark for variants with 0.2–0.3% or 0.1–0.2% VAF (Fig. 4a).”

“The performance characteristics of the assays evaluated here were broadly similar to what has been reported by several ctDNA sequencing providers (based on internal testing) that did not participate in this study. **During validation of the Guardant360 CDx hybrid capture assay, variants were detected with high sensitivity (~94%) at VAF ≥ 0.4%, declining to ~64% among variants with VAF ranging from 0.05% to 0.25%.** **FoundationACT showed ~99% sensitivity for SNVs with VAF > 0.5%, ~95% for 0.25%–0.5% VAF and ~70% for 0.125–0.25% VAF.**”
